**INTERNATIONAL ASSOCIATION OF GEODESY**  
**NATIONAL REPORT OF PORTUGAL**

## **1 – FORWARD**

The present report contains the information about the work carried out in Portugal in the field of Geodesy, covering the period 2007-2010.

Each one of the following chapters is dedicated to the institutions (governmental agencies, universities and research centres), who reported relevant geodetic work:

- *Instituto Geográfico Português* (Portuguese Geographic Institute) - report by Eng. Manuela Vasconcelos;
- *Instituto de Investigação Científica Tropical* (Tropical Science Research Institute) - report by Dr. Paula Santos;
- *Laboratório Nacional de Engenharia Civil* (National Laboratory of Civil Engineering) – report by Prof. João Casaca and Dr. José Nuno Lima;
- *Faculdade de Ciências da Universidade de Lisboa* (Faculty of Sciences of the University of Lisboa) – report by Prof. João Catalão;
- *Centro de Investigação em Ciências Geo-espaciais* (Geo-Space Sciences Research Centre) – report by Prof. José Pereira Osório;
- *Observatório Astronómico Prof. Manuel de Barros da Faculdade de Ciências da Universidade do Porto* (Astronomical Observatory Prof. Manuel de Barros of the Faculty of Sciences of the University of Porto) – report by Prof. Luisa Bastos.

It must also be mentioned the personal contribution to the work within the IAG structure, namely:

- João Agria Torres (SPUI/AGG) as President of the Regional Reference Frame Sub-commission of Commission 1 – Reference Frames.

## **2 - INSTITUTO GEOGRÁFICO PORTUGUÊS (PORTUGUESE GEOGRAPHIC INSTITUTE)**

### **2.1 – INTRODUCTION**

The Portuguese Geographic Institute (IGP) is the National Authority for Geodesy, Cartography and Cadastre. Therefore one of its main missions is the establishment and maintenance of the Portuguese Reference Systems and Frames.

In the Geodesy domain, IGP's most important projects are:

- the GNSS Continuously Operating Reference Stations (CORS) network;
- two tide gauges;
- the relative gravity stations network;
- the high precision levelling network;
- the geodetic network.

### **2.2 – ReNEP – THE GNSS CORS NETWORK**

In 1997 IGP installed the first CGPS station in Cascais (CASC), near the reference tide gauge, which is in operation since 1882. In the following years, until 2002, seven more stations were installed, having as main goal the maintenance of the Portuguese reference frames.

Since 2006 IGP is being working on the densification and the upgrade of the GNSS CORS (Continuously Operating Reference Stations) network - ReNEP - with two main goals:

- i) the maintenance of the national reference frames;
- ii) to provide a real time precise point positioning service.

At the present time the network consists of 44 CORS: 38 in the mainland and 6 on the islands (Azores and Madeira Archipelagos). Most of the stations collect both GPS and GLONASS data and 10 are connected to the high precision levelling network.

**INTERNATIONAL ASSOCIATION OF GEODESY**  
**NATIONAL REPORT OF PORTUGAL**

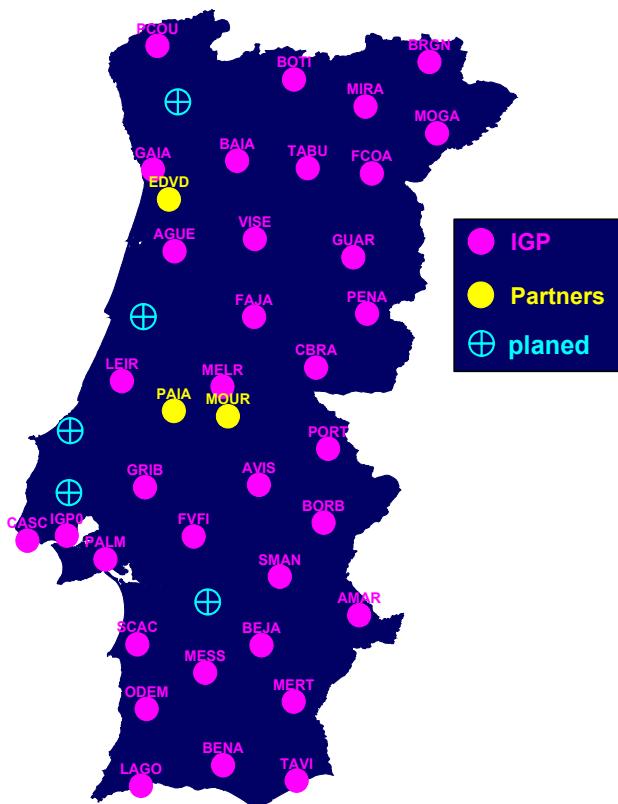

Figure 2.1 – ReNEP Status in Portugal Mainland.

ReNEP provides data for pos-processing (hourly RINEX files at 5 seconds rate) and real time applications.

The real-time corrections are distributed in RTCM format over the NTRIP protocol. There are three different types of products available: i) network coverage; ii) nearest-site; and iii) single-base station, for those users whose equipments cannot send NMEA messages. Presently there are more than 1000 registered users for real-time applications and about 500 daily connections to the server.

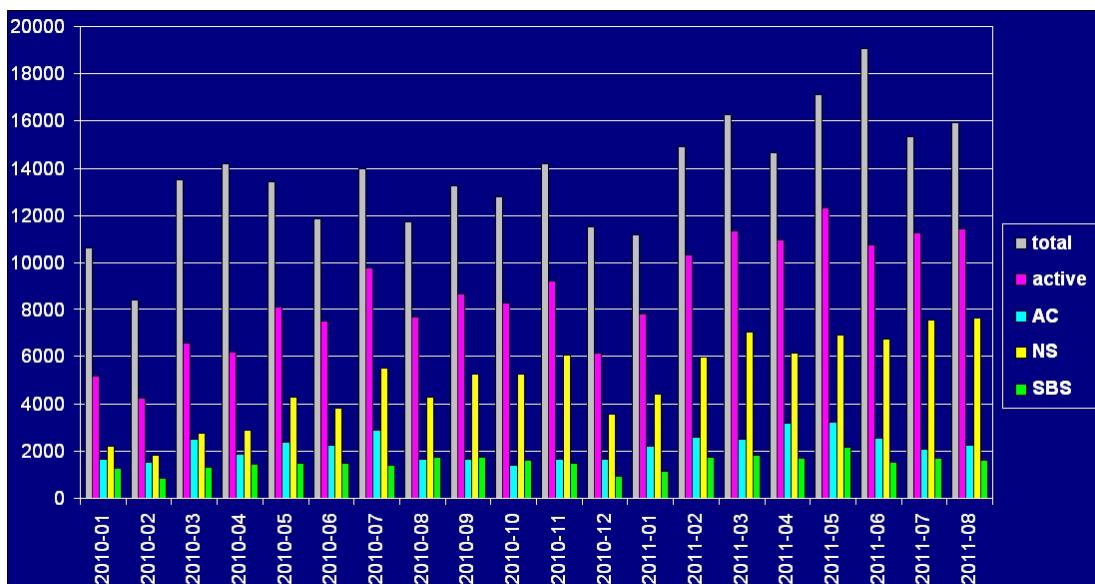

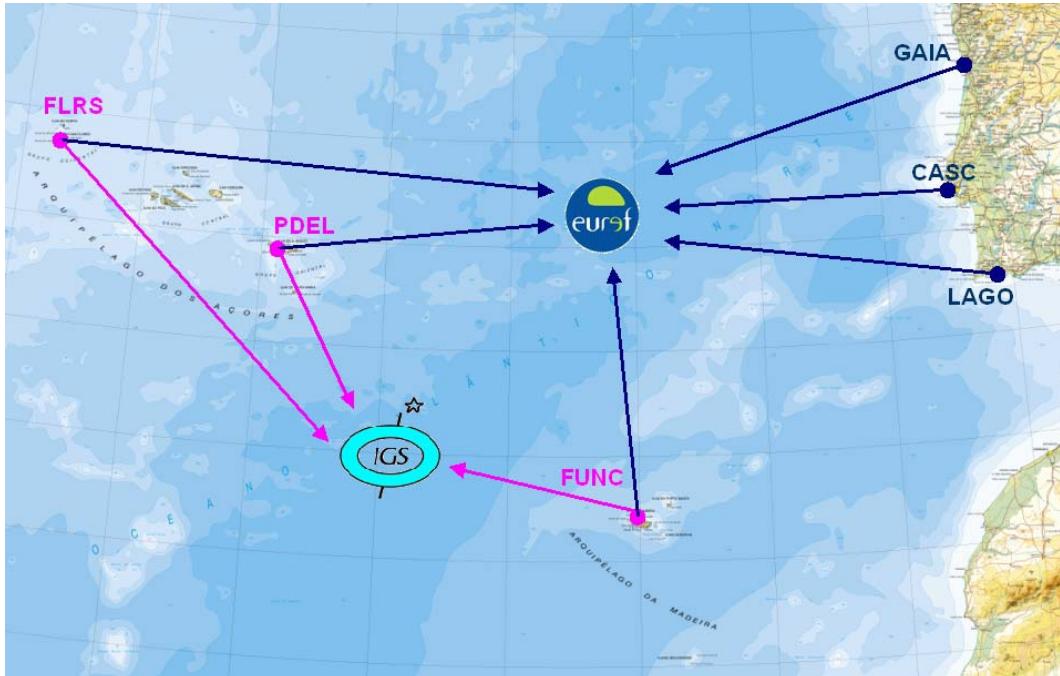

Figure 2.2 – Monthly accesses to ReNEP real-time products.  
AC: auto-cell network coverage; NS: nearest site; SBS: single base station.

The tests done in order to evaluate the quality of the real-time positioning service show an average accuracy better than 5 cm in ETRS89, and better than 10 cm when working in the older classical reference systems.

Six of IGP's stations are part of the EPN (EUREF Permanent Network) and 3 of these also belong to the IGS (International GNSS Service) network, providing both RINEX data and the real-time streamings.

*Figure 2.3 –ReNEP Stations belonging to EPN and IGS networks.*

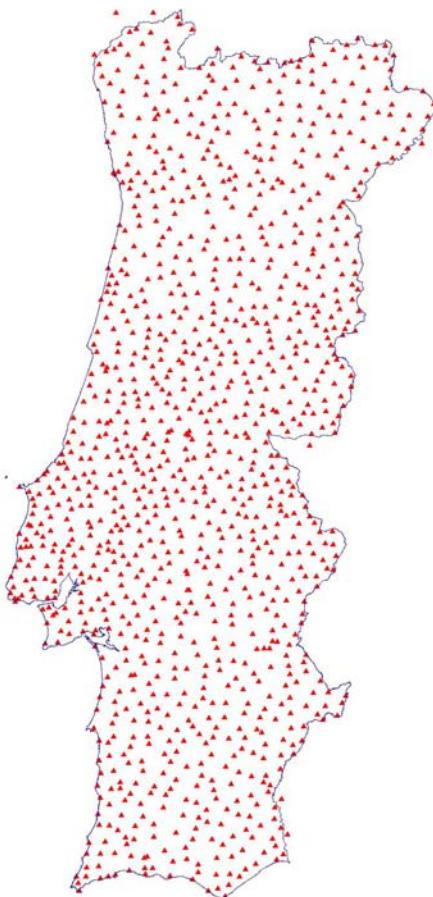

IGP participated in EUREF's project "Monitoring of official national ETRF coordinates on EPN web" with its three CORS located in the mainland. The next table shows the differences between the coordinates determined by EUREF and the official IGP coordinates, in ETRF2000 epoch 2000.0.

Table 2.1 –Differences between EUREF publish coordinates and IGP official coordinates for the 3 EPN stations in Portugal Mainland.

Station	Differences		
	X (m)	Y (m)	Z (m)
CASC	-0.020	0.012	-0.005
GAIA	0.022	-0.002	0.016
LAGO	0.001	0.020	-0.007

### 2.3 – MAINTENANCE OF ETRS89

In 1989 Portugal participated in the first GPS campaign promoted by EUREF (the IAG Sub-Commission for the European Reference Frame) with the purpose of connecting the European countries. Given that these measurements did not cover appropriately the Iberian Peninsula, a densification network was measured later on in the IBERIA 95 campaign. Between 1999 and 2004 the 1st and 2nd orders geodetic networks (around 1000 trig points) were measured with GPS and connected to the results of IBERIA95. The geodetic network of Portugal mainland is now a realization of the ETRS89, called PT-TM06/ETRS89.

*Figure 2.4 – Realization of ETRS89 in Portugal Mainland.*

The Geodetic Network was connected to ReNEP with GNSS measurements. Since nowadays most of the operators make use ReNEP in real-time, it was important to evaluate the consistency between these two networks. To do that, IGP is performing RTK measurements in some points of the Geodetic Network. The differences between the official coordinates and the RTK coordinates are shown in the next table.

Table 2.2 –Differences between official PT-TM06/ETRS89 coordinates and coordinates obtained with RTK measurements.

Differences (m)	X	Y
<b>Max</b>	<b>0.033</b>	<b>0.035</b>
<b>Average</b>	<b>0.000</b>	<b>0.009</b>
<b>Min</b>	<b>-0.018</b>	<b>-0.013</b>
<b>e.m.q.</b>	<b>0.012</b>	<b>0.014</b>

In the Azores and Madeira archipelagos a group of points was measured in the international GPS campaign TANGO1994 (Trans-Atlantic Network for Geodynamics and Oceanography). In the subsequent years the geodetic networks of all the islands were measured with GPS and a realization of ITRS93 (PTRA08-UTM/ITRF93) was established as the reference frame for the archipelagos.

The parameters for coordinate transformation from the old geodetic reference systems to PT-TM06/ETRS89 and PTRA08-UTM/ITRF93 were determined. IGP also provide software for coordinate transformation and applications for the transformation of vector data to these new systems.

## 2.4 – TIDE GAUGES

IGP is responsible for two acoustic tide gauges, at Cascais and Lagos. The Cascais tide gauge is the reference for the mainland ordinance datum. At Cascais there is also a floating tide gauge, installed in 1882 that is still working.

The systems record sea level measurements at 5 seconds rate and all the data are streamed to IGP central office. Both tide gauges contribute with their data to SLEAC (Levels along the European Atlantic Coastline) and IOC (Intergovernmental Oceanographic Commission of UNESCO).

Figure 2.5 – Cascais Tide Gauges. Left: Borel Floating System. Right: Acoustic.

## 2.5 – GEOID MODEL

In 2009 the geoid model for Portugal mainland – GeodPT08 - was made available for public download in ASCII format. This model, calculated in a cooperation between IGP and FCUL (Faculty of Sciences of the University of Lisbon), is based in the gravity network measurements, and afterwards was adjusted to the levelling and geodetic networks.

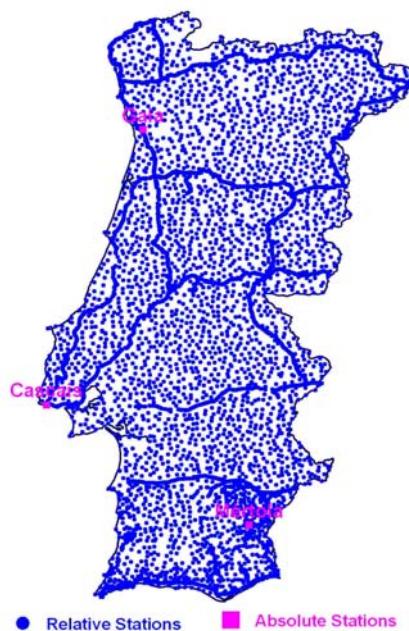

Figure 2.6 – Gravimetric Network of Portugal mainland.

**INTERNATIONAL ASSOCIATION OF GEODESY  
NATIONAL REPORT OF PORTUGAL**

In order to evaluate the accuracy of the GeodPT08 RTK measurements were made in leveling benchmarks and geodetic trig points, which were not included in the geoid determination. The average difference between the official orthometric heights and the ones obtained from RTK and the geoid is 5cm for the leveling benchmarks and 8 cm for the geodetic trig points.

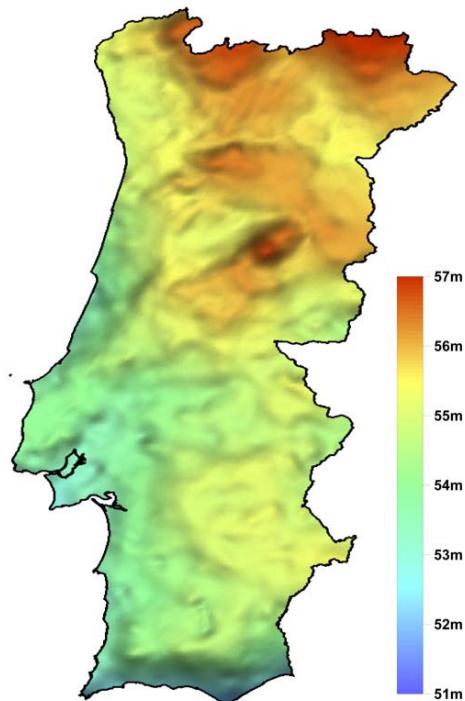

Figure 2.7 – GeodPT08.

## 2.6 – EUREF WEB SITE

Since its creation the EUREF web page is developed and maintained by IGP. In 2011 the structure and the lay out of the web page was rearranged.

Figure 2.8 – EUREF web site front page.

## 2.7 – HUMAN AND MATERIAL RESOURCES

The human resources of the Department of Geodesy of IGP are four surveying engineers and six surveying technicians. The equipment consists on:

- GNSS receivers;
- geodetic levels;
- optical-mechanics theodolites (astronomy, geodesy and surveying);
- 2 LaCoste & Romberg, model G gravimeters;
- Bernese software;
- and several software for processing the different kinds of geodetic measurements and data.

### 3 – INSTITUTO DE INVESTIGAÇÃO CIENTÍFICA TROPICAL (*TROPICAL SCIENCE RESEARCH INSTITUTE*)

#### 3.1 – INTRODUCTION

The Tropical Research Institute (IICT) promotes tropical knowledge by pursuing interdisciplinary research of relevance to countries in tropical regions. It has a special mandate towards the Community of Portuguese Speaking Countries (CPLP), whose members are Brazil, East Timor, five African nations and Portugal.

Established in 1883 as the Commission of Cartography, IICT is the oldest autonomous government agency that conducts research for development in human and natural sciences. In 1983 IICT became a state laboratory under the supervision of the Minister for Science, Technology and Higher Education.

Through the output of over 100 researchers, it seeks to increase the scientific and technical capacity of developing countries and also to ensure the preservation of its documental collections.

The strategic objectives underlying the work program are

- 1) helping promote the Millennium Development Goals with special emphasis on CPLP countries;
- 2) facilitating access of CPLP countries to its vast historic and scientific heritage, as recommended by the CPLP Ministers of Science and Technology in 2003. Two services open to the public, the Overseas Historical Archive and the Tropical Botanic Garden are included among the six research centers.

The Geoinformation for Development Centre (GeoDES) develops its activity based on geographic information management and processing to support the development of tropical countries, namely the Community of Portuguese Language Countries (CPLP). As this Centre is directly linked to the Commission of Cartography geographic information collections related with PALOP are part of its heritage (e.g., topographic and thematic maps, geodesic data, aerial photography, etc.).

The Portuguese participation on GMES and Africa initiative (an extension of the European GMES services and applications) is assured by IICT. The long-term cooperation strategy is developed based on applications and services proposed and developed within the scope of this Africa-Europe initiative.

Currently GeoDES covers a diverse number of fields, such as: land use and land cover using remote sensing information, assessment of natural and man-made hazards based on spatial analysis, geodesy, border monitoring and management of Geographical Information of CPLP countries existing at IICT.

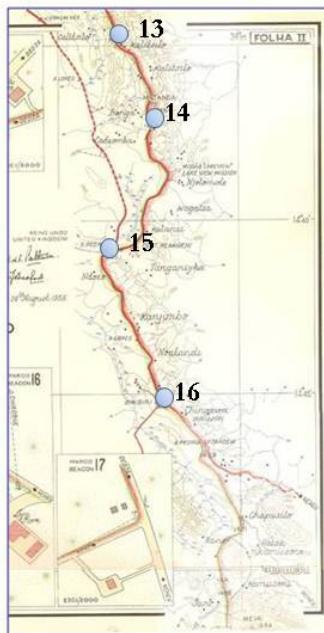

#### 3.2 – RESEARCH & DEVELOPMENT PROJECTS

IICT/GeoDes activity is based on the implementation of research projects using geodesy and geospatial technologies (remote sensing, GIS, GPS) applied to studies contributing for the development of Tropical countries, namely CPLP countries. The following list provides a summary of the main geodetic research and development projects and initiatives lately developed at IICT/GeoDes as coordinator or participant:

- **Geodetic classical networks of CPLP countries:** after the adjustment of those networks, a database including all the benchmarks and associated information such as type, local, access and adjusted coordinates is being prepared in order to respond to many solicitations from geodetical institutions or companies from those countries. Since GPS observations are available, its also calculated the transformations parameters to the reference systems used by the GPS.
- **Study and organization of the diplomatic and technical information concerning CPLP countries boundaries** in order to help them to achieve the goals of the African Union Border program. With Mozambique is being prepared a cooperation project to construct a Boundary Geographical system to the management of its frontiers.

## NYASALAND – MOZAMBIQUE FRONTIER

Agreement of Nov 18, 1954

From beacon 11 by the eastern loop (lake view road – Nyasaland) to beacon 15 erected at the junction of this road with the main Dedza-Ncheu road approximately 1 Km west of Fort Mlangeni demarcated by beacons 13, 14, and 15

Thence by the main Dedza-Ncheu road (Nyasaland), to beacon 17 erected at the road junction 1.5 km south of Biriwiri trading centre, demarcated by beacons 16 and 17

Thence by the road, inclusive to Nyasaland leading along the general line of the Zambezi-Shire watershed as far as beacon 24

INTERNATIONAL ASSOCIATION OF GEODESY  
NATIONAL REPORT OF PORTUGAL

- Installation, tests, management and dissemination of a **GNSS Permanent Station** data included in a network of 5 stations implemented with international requests to serve the national geophysical network.

GNSS permanent network: GEONET

IICT GNSS permanent station

**INTERNATIONAL ASSOCIATION OF GEODESY  
NATIONAL REPORT OF PORTUGAL**

- **Knowledge and recognition in areas of Portuguese influence: registries, scientific missions, traditional knowledge and biodiversity in Subsaharian Africa and Insulindia**, interdisciplinary project with the History Centre financed by Fundação para a Ciência e Tecnologia (FCT-foundation for science and technology): identification and inventory of both the existent bibliography and the documentary sources relevant for the project; inventory and study of reports, field notes, photographs , maps, personal papers and other documents of the geographical (geodesy, astronomy, cartography and hydrography) missions of the 19<sup>th</sup> and 20<sup>th</sup> centuries; development of a Ms-Acess database to store and organize the thematic information collected. These databases will be ported, later on, to a GIS that will be available on-line.
- 
- **Half a century of colonial science: crossing views on the archive and the scientific activity of the Comissão de Cartografia (1883-1936)**, interdisciplinary project with the history centre and the overseas historical archive financed by FCT: preservation treatment, description and contextualization of c. 1400 photographic items related to delimitation of boundaries and geodetical missions. Integration of those images in an informatic platform for on-line access. Scientific studies on the cartographic science in Portugal and the way it influenced the development of other disciplines , mainly regarding scientific missions to recognize the territories and local peoples past.
- **Exhibitions concerning old works of the geographical missions in Africa and its instruments**
- **Tribute exhibition to the admiral Gago Coutinho, a famous Portuguese geographer, responsible for the delimitation of several African boundaries and for the first geodetical mission in Africa.**

### **3.3 – HUMAN AND MATERIAL RESOURCES**

The human resources is one Researcher (PhD equivalent).

The equipment consists on:

- GPS receiver TRIMBLE NetR5 with Zephyr Geodetic2 (TRM57971.00) antena for GPS L1/L2, L2C, L5, GLONASS and Galileo and software
- 3 dual-frequency GPS receivers (Trimble 4000)
- 1 C/A code GPS receiver (Trimble Pathfinder Pro XL)
- 1 Gravimeter LaCoste & Romberg model G
- 2 Theodolite Total Stations
- Several optical-mechanics theodolites (Astronomy, Geodesy and Surveying)
- Several Geodetic Levels.
- Several Pentium Computers
- Bernese GPS Software Version 4.2
- GPSurvey Software (Trimble)
- Gravimetry Adjustment and Computation Software (LaCoste & Romberg)
- Gravimetry Adjustment and Computation Software (Finnish Geodetic Institute)
- Triangulation Adjustment and Computation Software
- Levelling Adjustment and Computation Software

## 4 – LABORATÓRIO NACIONAL DE ENGENHARIA CIVIL (NATIONAL LABORATORY OF CIVIL ENGINEERING)

### 4.1 – R&D PROJECTS IN THE DOMAIN OF APPLIED GEODESY

#### 4.1.1 Improving Methods of Applied Geodesy to the Observation of Engineering Works

This project is integrated in the Programmed Research Plan (*Plano de Investigação Programada – PIP*) of LNEC, and it includes a set of R&D activities developed with the aim of supporting the improvement and the updating of the important contribution provided, in a regular basis, by the Applied Geodesy Division (*Núcleo de Geodesia Aplicada – NGA*) to the monitoring of large engineering works (dams, bridges, etc.). The proposed project has a remarkable incidence in the engineering works observation activity, carried out in the Departments of Dams, Structures and Geotechnics. The geodetic observation activity plays an important role in the safety control of engineering works, and it demands a constant renewal of the measuring equipment, operative methods, and models for the observations processing, in order to offer a better accuracies and faster response times. The main purpose of this project consists on the study and improvement of the geodetic methods to the observation of large engineering works, essentially at two levels:

- i) Equipment for geodetic observation (including a GNSS permanent station and an EDM baseline test in LNEC campus).
- ii) Methods and models for the treatment of the observed data and quality evaluation of measurement and results.

In the scope of this project it was performed a test on automated dam displacement monitoring using a robotic total station (controlled by softwares Alert, from Chrzanowski & Assocites, and GeoMoS from Leica Geosystems) and GNSS equipment (controlled by SPIDER and GeoMoS both from Leica Geosystems).

#### 4.1.2 SUBSIn – InSAR Detection and Characterization of Subsidence and Landslide in the Lisbon Region (PTDC/CTE-GEX/65261/2006)

This project had financial support by the *Fundação para a Ciência e Tecnologia* (FCT, Portuguese Foundation for the Science and Technology), during the period of 2008 – 2010. The project aims were:

- i) Detect, quantify, and characterize ground deformation in the Lisbon region with synthetic aperture radar interferometry techniques (conventional InSAR and PSInSAR), together with permanent GPS data and leveling observations.
- ii) Isolate the seasonal groundwater-related regional deformation from other possible origins (e.g. tectonic) and diagnose the possibility of aquifer/aquitard irreversible compaction and associated risks of ground subsidence or coastal aquifer salinization.
- iii) Contribute to landslide mapping in the north of Lisbon region, discriminate between active and non-active areas, and improve the understanding of landslide activation mechanisms, namely rainfall accumulation and elevation of water-table levels.
- iv) Detect and inventory, with PSInSAR, localized of urban subsidence (edifices and structures) in Lisbon, and confirm/calibrate the results with data from databases of geodetic monitoring around tunneling or other engineering works in the area.

NGA's participation in this Project, led by Instituto Superior Técnico (IST, School of Engineering), was to validate SAR results by using data from permanent GPS stations and levelling observations.

### 4.2 – ORGANIZING SYMPOSIUM

#### 4.2.1 Joint Symposium “Measuring the Changes” of the FIG 13<sup>th</sup> Symposium on Deformation Measurement and Analysis and the IAG 4<sup>th</sup> Symposium on Geodesy for Geotechnical and Structural Engineering

The second jointly held symposium on deformation measurements and analysis was held May 12- 15, 2008 in Lisbon, Portugal. The symposium was a combined meeting of FIG Commission 6, Working

**INTERNATIONAL ASSOCIATION OF GEODESY**  
**NATIONAL REPORT OF PORTUGAL**

Group 6.1, Deformation Measurements and Analysis (13<sup>th</sup> FIG Symposium on Deformation Measurements and Analysis) and the IAG Sub-commission 4.2, Applications of Geodesy in Engineering (4<sup>th</sup> IAG Symposium on Geodesy for Geotechnical and Structural Engineering). The theme of the symposium "Measuring the Changes", reflects the importance, and demand, for fully automated, continuous, and reliable deformation monitoring in civil engineering, mining, and energy sectors. In addition there is a strong trend to incorporate deformation systems into new structures from the very beginning, driven by concerns for whole-of-life structural health monitoring. Automation, multi-sensor integration, continuous data collection, integrated analysis and physical interpretation, and enhanced accuracy and reliability are the key developments in new monitoring systems. These issues are the subject of studies of these two international working groups.

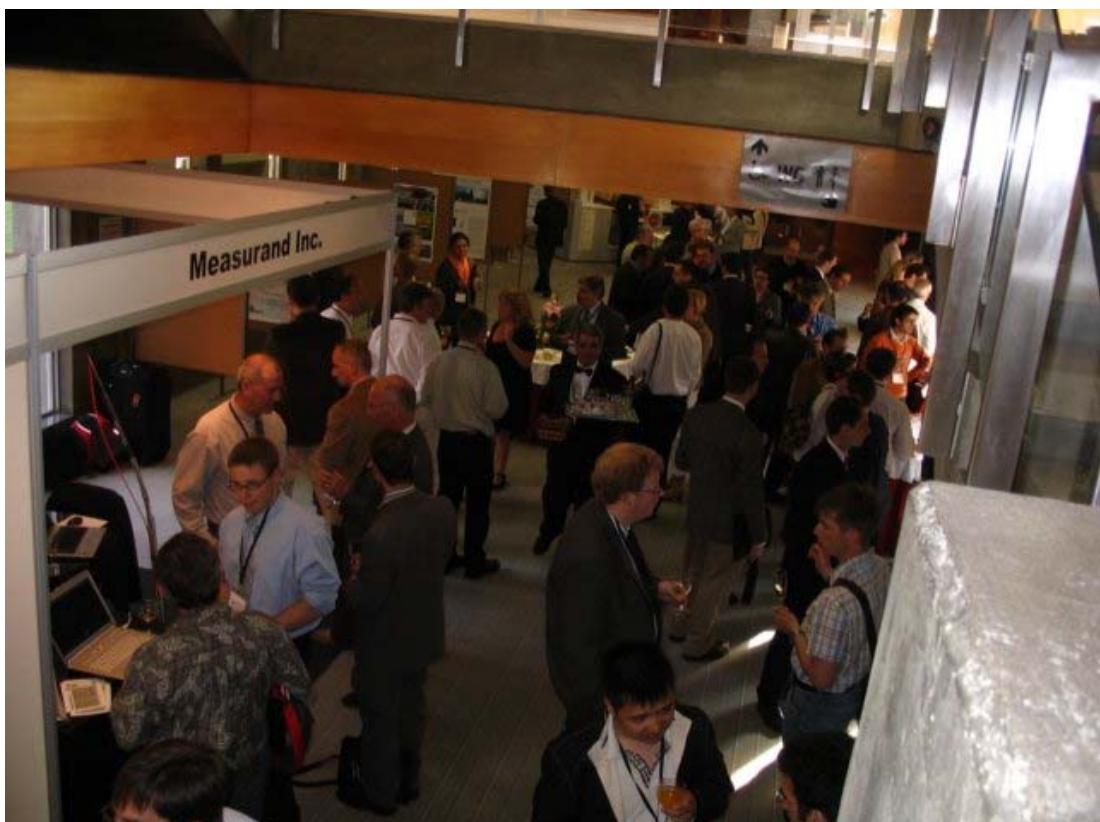

The symposium was attended by about 160 delegates from 30 countries (information about the symposium can be found at the official site of the organizers: <http://measuringchanges.inec.pt>).

The symposium had 20 technical sessions with topics ranging from modeling (4 sessions), monitoring of structures (3 sessions), GNSS (2 sessions), geodeformations (2 sessions), radar (2 sessions), equipment (2 sessions), laser scanning, engineering geodesy, multi-techniques and posters papers (2 sessions). In addition, there was a special session for those interested in fiber optic sensors hosted by the FIG WG 6.4 (Engineering Surveys for Construction Works and Structural Engineering) task force on fiber optic sensors.

**INTERNATIONAL ASSOCIATION OF GEODESY**  
**NATIONAL REPORT OF PORTUGAL**

Keynote presentations by each chair of the two organization started off the symposium and were followed by many excellent presentations and posters papers throughout the event.

There was also great participation by supporting vendors in the exhibitor's session. There were exhibits from Leica Geosystems, Sokkia Europe, Topcon, Fiber Sensing, Trimble and Measurand Geotechnical. These exhibitors were very active participants with all types of equipment demonstrations taking place inside and outside of the symposium event hall. Many attendees received personalized and hands-on experience with the equipment.

Another aspect of the symposium is the great support the organizing committee received from the vendors to help sponsor this event. The vendors that sponsored the symposium at platinum level were Leica Geosystems, Topcon and Trimble. At the silver level support was received from GAUSS, SPGO, Portuguese Geographic Institute (IGP), Sokkia Europe, Sol Data Iberia and Technasol FGE. The organizers and chair of the symposium sincerely express their appreciation for the support these organizations provide for these meetings to take place.

**INTERNATIONAL ASSOCIATION OF GEODESY  
NATIONAL REPORT OF PORTUGAL**

It is also important to stress that several organization provided financial support for seven young colleagues to attend the symposium. The grants were supported by: IAG (3), Topcon (1), *Ordem dos Engenheiros* (Engineers Association of Portugal, 3).

No symposium is complete without a social event to “loosen up” the attendees for a night of mingling and making new friends and connections. The LNEC provided a wonderful evening of fun by hosting a dinner at Lusitania Horse Training Center. The evening started with a show of the horse’s skill in historic battlefield maneuvers and was followed by an excellent dinner with a show of the traditional Portuguese *fado* music.

**INTERNATIONAL ASSOCIATION OF GEODESY**  
**NATIONAL REPORT OF PORTUGAL**

The day after the symposium end was a technical field trip to visit Alqueva Dam and the three Alamos dams. This trip provided attendees the opportunity to observe the Portugal countryside and to see the issues that Portuguese dam engineers and surveyors face close up.

**Scientific Committee**

João Casaca (Portugal), Chair;  
Luísa Bastos (Portugal), Fritz Brunner (Austria), Dorota Brzezinska (USA), Adam Chrzanowski (Canada), Xiaoli Ding (Hong Kong), Antonio Gil (Spain), Svend Johansen (Denmark), Alojz Kopacik (Slovakia), Gyula Mentes (Hungary), Wolfgang Niemeier (Germany), Witold Proszynski (Poland), Chris Rizos (Australia), Gethin Roberts (United Kingdom), Fernando Sanso (Italy), Stathis Stiros (Greece), Yukio Tamura (Japan).

**Local Organizing Committee**

Maria João Henriques (Portugal), Chair;  
Rui Manuel Fernandes (Portugal), José Nuno Lima (Portugal), João Agria Torres (Portugal), Manuela Vasconcelos (Portugal).

**4.2.2 II Encontro Nacional de Geodesia Aplicada (2<sup>nd</sup> National Meeting of Applied Geodesy)**

The Meeting was held October 12 – 13, 2009 in Lisbon, at Congress Centre of National Laboratory of Civil Engineering. The main purpose of this meeting was to join technicians, professors and researchers interested in different applications of the methods of the Geodesy. The Meeting received more than 20 contributions on applications of Geodesy in several areas, namely: geodynamic studies, displacements monitoring of small and large structures such as dams or bridges, embankments, undergrounds or maritime works; conversion of data problems; processing and analysis of data.

The Meeting was attended by about 60 participants and more than 20 papers. Leica Geosystem, EDP, Mota-Engil and InlandGEO/Topcon sponsored the Meeting.

**INTERNATIONAL ASSOCIATION OF GEODESY  
NATIONAL REPORT OF PORTUGAL**

**Scientific Committee**

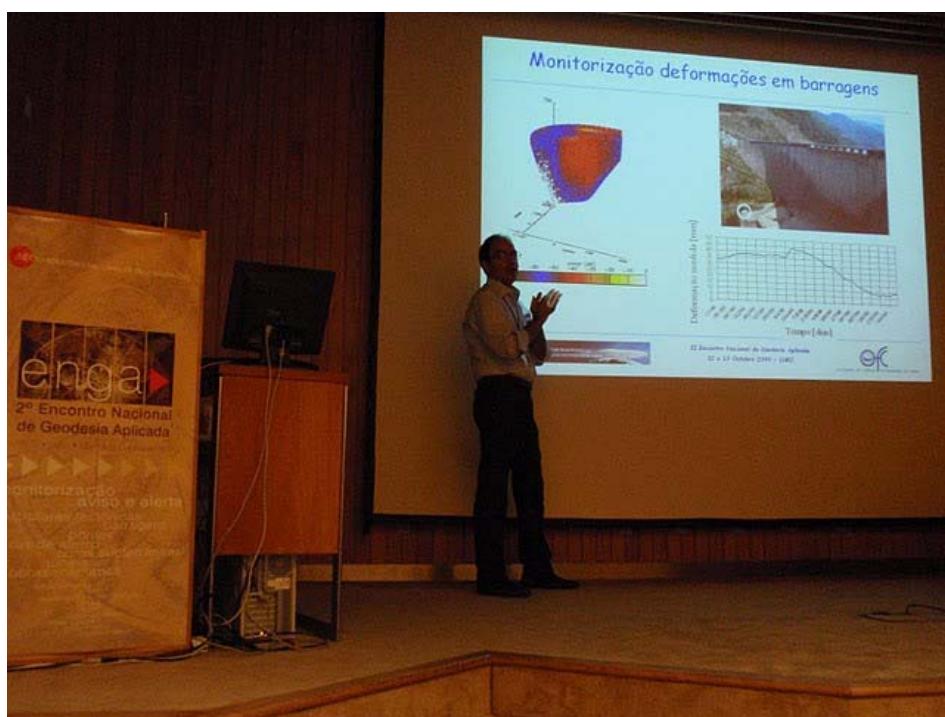

João Casaca (LNEC, Portugal), Chair;

António J. Gil (University of Jaen, Spain), António Tavares de Castro (LNEC, Portugal), João Agria Torres (IAG, Portugal), João Catalão Fernandes (University of Lisbon, Portugal), João Matos (Technical University of Lisbon, Portugal), José Alberto Gonçalves (University of Porto, Portugal), Luís Oliveira Santos (LNEC, Portugal), Luísa Bastos (University of Porto, Portugal), Rui Fernandes (University of Beira Interior, Portugal), Sandra Heleno (Technical University of Lisbon, Portugal), Virgilio Mendes (University of Lisbon, Portugal).

**Organizing Committee**

Maria João Henriques (LNEC, Portugal), Chair;

Ana Fonseca (LNEC, Portugal), Carlos Antunes (University of Lisbon, Portugal), Elisa Almeida (EDP, Portugal), José Nuno Lima (LNEC, Portugal), Manuela Vasconcelos (IGP, Portugal), Teresa Sá Pereira (Lisbon Harbour Office, Portugal), Vítor Charneca (University of Algrave, Portugal).

## 5 – FACULDADE DE CIÊNCIAS DA UNIVERSIDADE DE LISBOA (FACULTY OF SCIENCES OF THE UNIVERSITY OF LISBOA)

### 5.1 – INTRODUCTION

In the last 4 years, the research of the group has been focused on the following topics: (a) GNSS data processing and analysis for geodynamics studies, (b) Improvement of Reference Frames, (c) GPS meteorology, (d) Gravity field modeling and Geoid, and (e) Ground deformation monitoring using radar interferometry.

### 5.2 – PROJECTS

MegaHazards (PTDC/CTE-GIX/108149/2008): Eventos de escorregamentos de massa ao longo da evolução geológica das ilhas Açoreanas: cronologia, recorrência, mecanismos, e consequências (MEGA hazards); Director: FERNANDO MANUEL ORNELAS GUERREIRO MARQUES.

Estudo do impacte das alterações climáticas nos sistemas de regadio e definição de medidas de adaptação. (PTDC/AAC-AMB/113639/2009); Director: José Luis Monteiro Teixeira.

“SHA-AZORES” - Seismic Hazard Assessment in the AZORES through neotectonics and paleoseismology studies. Fundação para a Ciência e a Tecnologia (PTDC/CTE-GIX/108637/2008), 2010-2012

## 6 – CENTRO DE INVESTIGAÇÃO EM CIÊNCIAS GEO-ESPACIAIS (GEO-SPACE SCIENCES RESEARCH CENTRE)

### 6.1 – MAIN AREAS OF ACTIVITY IN GEODESY

In the period 2007-2009, the activities of this research Unit, belonging to different fields of the Earth and Space Sciences, were organized in three Groups:

- Satellite Positioning and Navigation, Radioastronomy and Reference Systems;
- Sea level change and ocean circulation studies from satellite altimetry and multi-sensor data;
- Remote Sensing, Image Processing and GIS.

Since 2010 January 1, the organization is the following:

**Group 1** – Satellite Positioning and Navigation, Coastal Zones, Space Weather and Reference Systems;

**Group 2** – Remote Sensing, Image Processing and GIS.

### 6.2 – FIELDS OF EXPERTISE

#### **Group 1 - Satellite Positioning and Navigation, Coastal Zones Applications, Space Weather and Reference Systems**

- Satellite Positioning and Navigation: GNSS Applications in different areas of human activity (plate tectonics and volcanism, aeronautics, agriculture, environment, mobile phones, urban traffic control, atmospheric studies and outer space); GNSS Permanent Network (GEONET), as part of the National Geophysical Network; GPS Software Receiver for Location-Based Services.
- Coastal Zones Applications: Retrieving TSM concentration from multi-spectral satellite data; Estimation of river plume size based on image segmentation; Beach hydromorphological behavior analysis through remote sensing data and image processing techniques; Bathymetric estimation through principal components analysis using satellite data; Extraction of a sand spit (Cabedelo - Douro estuary) from IKONOS-2 satellite images through image processing techniques; Breakwater stability analysis through a non permanent DGPS network – Madeira Harbour, Portugal.
- Space Weather: Solar Energetic Particle Events: models of particle propagation in the interplanetary medium and particle interaction with detectors in space; Large Scale Structure of the Solar Wind; Solar Radio Emissions associated with flares, CMEs and shocks using data from our radio-telescope operating in the 100 MHz to 1 GHz frequency range; Models of Near Earth Radiation Environment.
- Reference Systems: GAIA – Global Astrometric Interferometer for Astrophysics. To translate the position precision of Gaia into astrometric accuracy a Primary Reference Frame formed by thousands of Quasi-Stellar Objects (QSOs) will be used during satellite observations. We have been involved in the selection and characterization of those QSOs, in terms of intrinsic properties (host galaxy, variability, redshift, etc.) in correlation to the accuracy and stability of the object's centroid coordinates. The main goal is to produce a list of confirmed and well studied QSOs that can help on defining the alignment between International Celestial Reference Frame (ICRF) and the Gaia Extragalactic Celestial Reference Frame (GCRF).

#### **Group 2 - Remote Sensing, Image Processing and GIS**

- Image Classification, Image Segmentation, Biomedical Applications of Image Processing.
- Digital Photogrammetry, Terrestrial Photogrammetry, Image orientation and DEM extraction from high resolution satellite images, Geometric Corrections of Satellite Imagery, Airborne and Terrestrial Laser Scanning, GIS data capture.
- Biogeography, Spatial Biology, Ecological Modelling, Precision Agriculture, Remote Sensing of Vegetation, Natural Resources Management.

### 6.3 – MAIN PROJECTS

**COST Action MP0905** – “Black Holes in a Violent Universe”.

**ERIG** – Education, Research and Innovation in the field of GNSS, Large European Consortium supported by the European GNSS Supervisor Authority (GSA).

**GEONET** – GNSS Permanent Network (FCUP, FCTUC, IICT, IPG and AFA), as part of the National Geophysical Network (supported by FCT).

**SOFTWARE RECEIVER** – GPS Software Receiver for Location-Based Services, developed within the framework of a PhD thesis.

**GNSS Applications** – Different Projects on the use of GNSS in several areas of human activity (plate tectonics and volcanism, aeronautics, agriculture, environment, mobile phones, urban traffic control, atmospheric studies and outer space).

**GAIA** – Global Astrometric Interferometer for Astrophysics, European Space Mission, member of the coordination unit CU3 – Core Processing (national participation supported by FCT).

**GREAT** – Gaia Research for European Astronomy Training

Working Group C3 “Quasars”; Working Group C2 “Astrometry Reference Frame”.

**TSM Concentration** – Retrieving TSM concentration from multispectral satellite data by linear regression and artificial neural networks.

**RIVER PLUME SIZE** – Estimation of the Douro river plume size based on image segmentation of MERIS scenes (ESA, Earth Observation Program, Category-1- ID#5899).

**Beach classification** - Beach hydromorphological classification through remote sensing data and image processing techniques.

**SANDY** - Cabedelo SAND Spit MorphoDYnamic Evolution and Modelling using IKONOS data – Douro River, Portugal (ESA, Earth Observation Program, Category-1- ID#6495).

**MoZCo** - Advanced methodologies and techniques development for coastal zone monitoring.

**The Near-Earth radiation** environment is being modelled through collaboration with LIP, as part of an effort funded by FCT. This work included both the modelling of particle propagation through interplanetary space and GEANT4 modelling of radiation monitors on board spacecraft.

**Energetics of Propagating Coronal Mass Ejections** are being studied through a SHINE collaboration with the University of California at Berkeley. Researchers from CICGE are involved in the analysis, reconstruction and calibration of radio images obtained through interferometric means. CICGE/ADFCUP is part of a Portuguese consortium including members from IT/Aveiro, CENTRA/IST, and Evora University, working to bring the **European Square Kilometre Array (SKA)** test site to Portugal. A site was selected in Herdade da Contenda in Moura. A demonstrator of the EMBRACE system was successfully tested in front of Portuguese authorities at Logica-EM headquarters in Moura, on March 2010. The prototype should be installed at its final site during 2011.

#### **Laser Scanning / DEM Generation**

- FCT Project “Forest and Fuel Variables Estimation and Digital Terrain Modelling with Airborne Laser Scanning and High Resolution Multi-Spectral Images”
- DEM extraction from ALOS-PRISM data

#### **Agriculture / Vegetation**

- LAMESAT\_XXI, FCT, 2007-2010, Ancestral irrigation management on mountain semi-natural meadows using remote sensing
- Remote Sensing for vineyard monitoring

#### **Biodiversity / Biogeography**

- Expansion model for a tree frog

#### **Biogeography of crocodiles**

#### **Image Processing Applications**

**Organization of conferences**

Young European Radio Astronomers' Conference - YERAC 2009

2009, CICGE-FCUP in collaboration with RadioNet

YERAC has been held annually since 1968, circulating round Europe. This was the first time that the event took place in Portugal. More information can be found in <http://www.fc.up.pt/yerac/yerac-2009> 42 students attended, from France, Germany, Hungary, Ireland, Italy, Netherlands, Poland, Portugal, Russia, South Africa, Spain and UK, and gave oral presentations. There were 4 local chairs and 3 additional organisers.

**7 – OBSERVATÓRIO ASTRONÓMICO PROF. MANUEL DE BARROS DA FACULDADE DE CIÊNCIAS DA UNIVERSIDADE DO PORTO (ASTRONOMICAL OBSERVATORY PROF. MANUEL DE BARROS OF THE FACULTY OF SCIENCES OF THE UNIVERSITY OF PORTO)**

### **7.1 – INTRODUCTION**

Presently the main areas of research at the Astronomical Observatory of the University of Porto (OAUP) are essentially satellite positioning and navigation, with applications in geodynamics, environmental monitoring, mobile mapping and airborne gravimetry.

The most relevant activities in the period 2007-2010 were:

- A new algorithm based on GPS/INS integration for airborne gravimetry was successfully implemented involving software development and hardware integration.

The system was applied in the acquisition of real data for regional geoid improvement in the Madeira Archipelago (Portugal).

- The group continued the work on coastal monitoring for vulnerability and risk assessment through the synergetic exploitation of several geodetic techniques. Environmental monitoring was based on different assessment tools with the exploitation of Mobile Mapping techniques (with videogrammetry) for the morphodynamic characterization of sandy littorals and the assessment of sediments transfer.

Improvements were introduced in the OAUP Mobile Mapping system based on the integration of GPS measurements with data from dead-reckoning sensors and videogrammetry.

New data was acquired in the scope of the sandy littorals monitoring program, using a multi-technique approach with the integration of data acquired with Mobile Mapping Technologies and airborne imagery data to build Digital Terrain Models (DTM) for the characterization of the morphodynamic evolution of sandy littorals.

- Maintenance of permanent GPS stations in the Azores region for geodynamic studies.

Continuation of the improvement of the algorithms for GPS time-series analysis, aiming at the detection and interpretation of seasonal signals.

An online GPS time-series analysis provider was implemented (GEODAC - [www.geodac.net](http://www.geodac.net)) in collaboration with the University of Beira-Interior. GEODAC is an initiative associated with the activities of the Inter Commission Project of the International Association of Geodesy, WEGENER. This facility allows the estimation of trends (in GPS time series) with realistic error bars. The time-series analysis software estimates, using MLE, the velocities of the North, East and Up component and the associated errors under the assumption that the noise is well described by a white plus power-law noise model.

The results can be returned in the form of tables and figures and/or archived in a MySQL database.

- The following list of publications and communications, resulting from the developed activities, expresses the main results achieved.
